

The Rise of EV/ESS Business in EU - What Is Going On In The Regulatory Field In Czechia? Get Ready For November 2021!

Electromobility and the development of energy storage devices is currently a major topic not only within the EU but also within individual member states.

Although there is no unified concept for supporting the sector, it is clear that all member states seek to support both the development and production of such products and their purchase from final customers. Some countries support the sector more, some less, but in general there is a growing trend to support the sector throughout the EU.

As part of our office's activities, we deal with the topic of electromobility and energy storage regularly and we monitor both legal and economic developments in this area.

In this newsletter, we would like to provide a basic overview of the current legal and economic situation on this topic.

We discuss the current regulatory moves planned by the government as well as explain the status quo of domestic legislation and why we still lag behind other European countries. The newsletter includes substantial deal of information on promotion of investment in the development and production of electric car batteries in the EU covering both National Action Plan for Clean Mobility as well as National Action Plan for Smart Grids.

Further, we provide you with up-to-date deal of information of the soon-to-be issued support for production and development of EV/ESS products.

You may find more info [HERE](#).
